

Executive Summary

Link to repository: [Github repo](#)

To quickly run through, the x-axis represents each unique file, while the y-axis represents how many weeks it has been since the repository has been made. For each contributor, a color has been assigned to represent their commits to the repository, along with which file and when.

Peeking at the commits done to repository [scottyab/rootbeer](#), we can thoroughly conduct an investigation on a repository's contributor productivity. The two most productive contributors who have been active since the start are Scott Alexander-Brown and Mathew Rollings, with 64 and 63 total commits respectively, even contributing to some of the more recent commits and being a large majority of the work done as seen in their red and orange color. Other notable members are mat and Frieder Bluemle, having a large amount of contributions, however have seem to have retired from contributing to this repository.

A majority of the other contributors appear to be temporary members, or interns who have only contributed a few times to the repository. To note, the repositories' commits are done in bursts, as we can tell by the gaps between large amounts of commits in a short span of time. This explains why a majority of the contributors have a few commits, as larger commits are preferred over small, daily commits.

In compiling this summary, a useful command was 'git blame', in which it allowed me to view who last modified a file. In doing so presented me information on our more active members.

For further inquiries about contributions to this repo, please contact Dr. John Businge.
