

Executive Summary

Project status report for scotty/rootbeer

To whom it may concern, here is a concise update on the scotty/rootbeer project hosted on GitHub. The project is advancing quickly and has many contributors to the project. Below I have created a scatterplot that represents the amount of work that has been put into the project over its lifespan:

As we can see, Scott Alexander-Brown, Mathew Rollings, and a few others deserve shoutouts for being super-stars this year in terms of work on the project. Scott and Mathew have been consistently working on the project through its lifespan. A lot of contributions were made but it should be noted that some people have seemed to stop working on the project completely or only have worked on it once.

Andy Barber had put in a lot of work with one single contribution but has seemed to have fallen off or may have quit working on the project altogether. Similarly, we can see this trend from Daniel Kutik who also contributed a big chunk but has not worked on the project consistently and only in bursts.

Ultimately, this gives us good information as to who is staying on track for projects and who may need some support to keep contributing to projects in the next year.

This scatterplot report was created using the GitHub API and pyplot to help represent this data in an easily digestible manner that can be used to leverage better productivity for upcoming quarters.

If you have any questions about this report, please don't hesitate to contact me at example@examplecompany.com.
